

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

FOREWORD.

Wood properly preserved is practically permanent wood, and because efficient avoids the cost of unnecessary replacements. The treatment of timber to make it last the limit of its serviceability is a fundamental feature of modern engineering. Briefly, in the following pages, the American Wood-Preservers' Association presents facts and figures for those becoming interested in the subject. Further information will be cheerfully given by any of its members or officers (see pages 47-55). Reference to the literature listed on pages 56-73 also is recommended. The most comprehensive publications on the subject are the Proceedings of the American Wood-Preservers' Association and Howard F. Weiss' "Preservation of Structural Timber." For the guidance of treating-plant operators, construction engineers, and others interested in the technique of wood preservation, the American Wood-Preservers' Association will soon issue the beginnings of a Manual of Recommended Practice.

By up-to-date methods and in conformity with the best practice wood can be so preserved that its life is prolonged to at least three times what it would be without treatment. Consumers of wood can figure the savings for their own particular service, after getting quotations from their nearest wood-preserving plant. Large users of treated wood estimate savings as follows: Ties, 2 to 10 cents per tie per year; piles, 20 to 100 cents per pile per year; poles, 5 to 15 cents per pole, per year; posts, 1 to 3 cents per post per year; mine timbers, 2 to 3 dollars per gangway set per year.

HANDBOOK ON WOOD PRESERVATION.

DECAY, PREPARATION AND TREATMENT OF WOOD.

Recent research has shown that the decay of wood is due to the functions of low forms of plant life known as fungi, not to fermentation of sap or soil reaction. These fungi feed on certain substances in the wood and so dissolve the wood structure that it crumbles. Thus is produced punky or rotten wood. Evidence of the existence of a fungus is to be had in the form of a "bracket," "conk," "dog ear," "punk," "rabbit ear," "toadstool," etc., which projects from a surface of wood. These external growths are the fruiting bodies of the fungi and their functions are to produce spores, or seeds, which adhere to them until dislodged by the air or other disseminating mediums. Wherever these spores alight on wood and find conditions favorable, they germinate and develop into destructive agencies. In addition to spreading by means of spores or seeds, fungi extend themselves from one piece of wood to another by growing over small intervening spaces. Consequently decaying wood is a menace to all sound wood in the vicinity.

To develop, fungi require air, food, moisture and warmth. Dampness is the most favorable condition for them. Since the control of atmosphere, precipitation, and temperature are not practicable with wood used outdoors, the surest way to stop fungi is to poison their food supply by injecting into wood substances on which they cannot subsist.

The various woods available for use in the United States differ widely in their lasting quality, or ability to resist decay. While the sap portion of all woods will soon decay under exposure to the weather, the heartwoods of catalpa, cedar, chestnut, cypress, locust, some oaks, some pines, redwood, walnut, and a few other woods are durable.

The growing scarcity and high prices of woods which remain sound long dictates in many localities the use of woods not so durable. The greatest economy is to be effected by confining preservative treatment to woods which are not of themselves resistant to decay, because these often-otherwise-unserviceable woods are obtainable at comparatively-low cost. How helpful preservatives are in enlarging the

number of usable woods may be seen in the following lists of kinds which without treatment could not render satisfactory service:

Posts		Ties	
Ash	Gum	Ash	Hickory
Basswood	Hickory	Beech	Maple
Beech	Maple	Birch	Oak (Red)
Birch	Oak (Red)	Elm	Pine (Sap)
Butternut	Pine (Sap)	Gum	Sycamore
Cottonwood	Poplar		
Elm	Sycamore		
	Willow		

The consumption of treatable woods as cross-ties is to be seen in the following figures for 1915:

Oaks, 16,885,517; southern pine, 8,541,203; Douglas fir, 3,553,854; western pine, 2,007,609; beech, 2,933,737; gum, 277,886; tamarack, 932,038; maple, 36,942; birch, 173,971; elm, 50,846; other species, 1,691,982; a total of 37,085,585 cross-ties.

The proper preparation of wood for treatment is essential to its successful preservation. Green wood resists the penetration of preservatives. The moisture which is in freshly fallen trees must be reduced in volume or consistency before it can be replaced by a preservative. This is accomplished by exposing the wood to the open air, by applying to it hot air in a kiln or steam in a closed cylinder, or by boiling it in hot oil. The method depends on the kind and the condition of the wood to be treated. But with any method for any kind of wood, the first step in its preparation for treatment is the removal of all bark.

Most woods can be prepared for treatment by being stacked on well-drained ground free from vegetation, in open piles for 4 to 12 months. In arid regions the piles should be less open than in humid regions, to avoid severe checking. Where wood splits while seasoning, irons of appropriate shape to stop the evil should be driven into the ends of the timber. Wood which is to dry in the open is preferably cut during winter, as spring and summer are the better seasoning periods.

The length of open-air preparation necessary or possible depends on the kind of wood, its dimensions, and the latitude of its storage. Oak may require 12 months seasoning in the vicinity of Philadelphia, while eight months may be enough around New Orleans. It might safely be held one and one-half times as long in either place. Gum, however, could and should be treated within eight months in the North and within four months in the South. The greater the surface area of a piece of wood in comparison to the volume, the more quickly will it dry. Most treated cross-ties are air-dried.

DECAY, PREPARATION AND TREATMENT OF WOOD 3

When open-air preparation is not feasible, steaming is usually resorted to. Care must be exercised that the pressure and its period are not carried to where the structure of the wood is injured. A vacuum is applied to dry the wood after its saturation by the steam. Most treated piles and structural timbers are prepared for treatment by steam.

On the Pacific Coast neither open-air nor steaming preparation is practiced. There the wood being treated is boiled in the creosote with which it is preserved.

After wood has been brought to a condition in which it can be treated it may be preserved by any of the processes referred to on pages 22-26.

The degree of treatment to be given varies with the kind and character of the wood and the service expected of it. In all cases the sapwood of treated material should be thoroughly penetrated by the preservative. The quantities of preservative usually left in timbers for various uses are as follows:

PRESERVATIVES INJECTED INTO WOOD.

Material Treated	Pounds Per Cubic Foot.	
	Creosote	Zinc Chloride
PILES:		
Salt Water	16 — 24	
Fresh Water	12 — 16	
Ground	8 — 12	
BLOCKS:		
Paving	16 — 20	
Flooring	6 — 12	$\frac{1}{4}$ — $\frac{1}{2}$
TIES	5 — 12	$\frac{1}{4}$ — $\frac{3}{4}$
TIMBER	8 — 16	$\frac{1}{4}$ — $\frac{1}{2}$

Since preservative treatment will not remedy structural defects of any kind, wood which is not free from decay or which has knots, splits, or other faults of sufficient size or number to weaken it for its purpose should not be treated.

Timber which has to be bored, dapped, mortised, or otherwise cut into during its erection should be so framed before treatment.

Preservation insures wood against deterioration.

CHRONICLE OF WOOD PRESERVATION.

The ancients were skilled in the art of preserving organic bodies. Pliny has said that they used garlic boiled in vinegar for protecting timber from attacks by worms. The early Egyptians embalmed their dead with oil of cedar, and later tar and linseed oil were recommended as preservatives. The Greeks and Romans recognized the antiseptic value of essential oils for preserving the wood they used in buildings. They also charred the wood to prevent decay. The Britons used to preserve the timbers of their warships against decay, either by soaking or coating them with petroleum oil, linseed oil, etc., and for a long time it was the practice to rub oil into the wood, or pour the oil into holes that had been bored into the wood. The Dutch early learned the advantage of preserving the timbers used in the construction of their dykes and marine structures by coating them with oil. The famous petroleum wells near Prome, in Burmah, furnished a good preservative for protecting wood used in ships and dwellings. But it was not until the early part of the nineteenth century that the preservation of wood by the injection of chemicals became scientific in principle and developed rapidly.

Numerous patents covering methods of preserving wood have been issued both in this country and abroad, and the early processes employing either animal oils, mineral oils or vegetable oils have been steadily improved. The mechanical operating features of these processes also have been improved, and the aim of the twentieth century wood-preserving plant is to afford wood as much protection against destruction as is possible, with as little preservative as will assure efficiency.

The growth of wood preservation in the United States from 1838, when the first cross-ties were treated by an infusion of bichloride of mercury and laid on the Northern Central Railroad in Maryland, now part of the Pennsylvania System, has been extraordinary.

The first commercial wood-preserving plant in the United States was built at Lowell, Mass., in 1848, using alternately bichloride of mercury and chloride of zinc, and it is still in operation.

The following chronological record of the wood-preserving industry begins in 1657, prior to which time authentic information is not available:

1 1657. Glauber experimented with vegetable pyroligneous acid (obtained by distillation of wood), first carbonizing the wood by fire, then covering it with tar and immersing the wood in the acid.

1 1705. Homberg used mercuric chloride for preserving wood.

1 1737. First American colonial privilege granted for preserving timber. Emerson patented a process for saturating timber with boiled oil mixed with poisonous substances.

1 1740. Reid proposed a method of using a vegetable acid (probably pyroligneous acid) as a bath for wood to protect it against decay.

1756. Hales recommended use of linseed oil for soaking planks at the water-line of ships to prevent decay.

1767. De Boissieu used mercuric chloride as a preservative. He and Bordenave recommended copper sulphate, the process being known as "Margaryizing."

1798. Volmeister washed and immersed wood in a solution of sea water.

1806. Perkins filled the interstices of wood with dry salt.

1809. First French patents on timber preservation granted as a result of the patent law created by Napoleon I.

1811. Lukin treated wood by burying it in pulverized charcoal in a heated oven.

1815. Wade recommended zinc chloride. Finding that alum was not a good preservative and rapidly decayed timber he suggested impregnation with resinous or oleaginous substances (especially linseed oil), or with common resin dissolved in a tank of caustic alkali, and subsequently plunged the wood into water acidulated with any cheap acid or with alum in solution. Bowden immersed wood in sea water. Boydon, of the British Navy Office, advocated boiling in lime water timber blocks and tree nails of ships, followed by boiling in a thin solution of glue, by means of which the pores of the wood would be filled by a hard substance insoluble in water. Boydon also thought that glue might be used with lime water, or glue and lime water mixed together, to check the growth of vegetation and strengthen wood.

1817. Chapman used copper sulphate, and experimented with lime, soap and alkaline salts.

1820. Pasley first boiled wood in water, and applied acids and other concentrated liquids.

1821. Knowles and Davy immersed wood in mercuric chloride.

1822. Precht exposed wood to the vapor of water alone and then to a mixture of water and tar.

1823. Oxford coated wood with oil of tar, previously treated with gaseous chlorine.

1824. Cox saturated wood with a mixture of fish oil, rosin and sulphur.

1825. Langton extracted by a vacuum the air from heated wood.

1826. Newmarch boiled wood in a mixture of linseed oil, iron sulphate, verdigris, arsenic and alum.

1828. Gossier alternately immersed wood in saline solutions containing calcium chloride, Glauber salts, iron sulphate and sodium arsenate.

1829. Carey first perforated wood and then introduced a mixture of salt, powdered charcoal and animal or vegetable oil.

1831. Breant invented an apparatus for forcing preservative liquids into wood.

1832. Kyan patented the injection into wood by pressure in a closed cylinder of mercuric chloride. Oxford patented the coating of timber with lead oxide, calcium carbonate and carbon of purified coal-tar, ground and mixed with oil. In this year was also tried smoking green wood to create a protective coating against decay.

1833. Attempts to arrest decay in wood by immersing or coating it with tar and tobacco leaves; also coating with rosin dissolved in fish oil, and coating with india rubber dissolved in fatty oils.

1834. Strutzke and the Society of Arts of London introduced the method of repeatedly coating wood with a solution of iron sulphate.

1835. Monteith immersed wood in lime water. Concentrated sulphuric acid as a coating to carbonize wood was also tried by an investigator. First wood pavements for city streets in the United States were laid in New York.

1836. Moll patented process for treating wood with coal-tar creosote in a closed iron vessel. Chevalier coated wood with a solution of tar and tobacco leaves.

1837. Boucherie recommended the use of zinc chloride. Margary's patent granted for using copper sulphate. Flockton saturated wood with oil of tar and iron acetate. Letellier immersed wood in a solution of mercuric chloride, and when dry subjected it to a coat of glue. Granville used the refuse water of salt works to preserve wood. Gottheil immersed wood in resinous solutions containing tar, oil of turpentine, and salt. The Industrial Society of Annaberg, Germany, introduced the method of immersing wood for a month in soluble glass, then placing it in water acidulated with hydrochloride acid, washing and drying, and finally rubbing it with oil.

1838. Bethell patented process for using coal-tar creosote, injected into wood under pressure in a cylinder. This process is still in use. Burnett patented the use of zinc chloride. Chestnut cross-ties, treated by the Kyan process, laid on the Northern Central Railroad of Maryland.

1839. Boucherie patented the absorption by the tree while alive or immediately after cutting, of iron acetate, acetic acid, muriate of lime, copper sulphate, mercuric chloride and other chemicals. Kyanized hemlock cross-ties laid at the fortifications at Fort Ontario, New York.

1840. Feiselli, after steaming the wood, injected a solution of alum and potash, or soluble glass and dilute sulphuric acid. Munzing immersed wood in a solution of muriate or protoxide of manganese, the refuse liquid of chlorine works. Pine stringers, subjected to a lime bath, laid on Philadelphia & Columbia Railroad. Kyanized oak ties laid on the Chesapeake & Ohio Railroad, and bridge timber treated by the same process used at Alexandria, Va.

1841. Payne patented the treatment of wood first with a solution of muriate of lime, iron sulphate and potash, and then with alum and potash. Pons immersed wood in a solution of iron nitrate, saltpeter, alum, and potassium ferrocyanide.

~ 1842. Timberly used mercuric chloride. Kyanized ties laid on Baltimore & Ohio Railroad.

1843. Parkes treated wood with caoutchouc dissolved in carburet of sulphur eupion. Earle immersed wood in a solution of iron sulphate or copper sulphate.

1844. Burkes first steamed the wood and then impregnated it with a solution of soluble glass and iron sulphate.

1845. Ransome, after removing the air from the wood, injected by pressure a solution of soluble glass, and later placed it in a diluted acid.

1846. The Eastern Massachusetts Railroad used the Kyan process. Blythe invented "thermo-carbolization," which consists in treating wood with carburetted steam to extract the sap and water, and at the same time inject into the wood creosote held in suspension. Payne, after extracting the air from wood, injected a solution of metallic sulphurets (lime and baryta), and finally an acid or metallic salt (iron sulphate, etc.). Venzat and Banner impregnated wood with a solution of sulphate or muriate of copper, and followed this with baryta.

— 1848. Wood preservation on a commercial scale began in the United States through building of a Kyanizing plant at Lowell, Mass., to treat timbers used in locks and canals on the Merrimac River. This plant is still in operation.

~ 1849. New York Central Railroad used Kyanized cross-ties.

~ 1850. Kyanized pine bridge timber used by the Philadelphia & Reading Railroad. First Burnettizing plant in America built at Lowell, Mass., to treat canal timbers.

— 1852. Philadelphia & Reading Railroad treated ties with tar.

— 1853. Fitchburg Railroad used Kyanized shop floor joists.

1854. Kyanized pine used for the Blackstone bridge of the New York & New England Railroad. Creosoted ties laid on Philadelphia & Reading Railroad.

~ 1855. Burnettized spruce stringers and ties laid on the Union (horse) Railroad of Cambridge, Mass.

— 1856. Vermont Central Railroad erected a Burnettizing plant for treating hemlock cross-ties and bridge timbers.

1857. Burnettized spruce used by the Middlesex & South Boston Railroad, and on the Boston, Mass., wharf.

~ 1860. Chicago, Rock Island & Pacific Railroad treated bridge timber with zinc chloride. Burnettized spruce bridge ties used on the Boston & Albany Railroad in Boston, Mass.

1861. Erie Railroad built a Burnettizing plant at Oswego, New York, which was burned in 1869, and has not been rebuilt.

1862. Burnettized bridge timber used by the Ohio & Mississippi Railroad.

1863. Philadelphia, Wilmington & Baltimore Railroad built Burnettizing plants, at Wilmington, Delaware, and Perryville, Maryland, to preserve timbers used in wooden bridge at Havre de Grace, Md.

1865. Old Colony Railroad erected a Bethell plant at Somerset, Mass., which is believed to be the first practical use of this process in the United States. Foreman applied to wood a dry powder of salt, arsenic and corrosive sublimate. Isaac Hinckley, late President of the Philadelphia, Wilmington & Baltimore Railroad, used creosote to preserve piles for bridge over the Taunton River on Old Colony Railroad in Massachusetts.

1866. Chicago, Rock Island and Pacific Railroad laid 2,000 Burnettized cross-ties.

1867. Philadelphia & Reading Railroad built a Burnettizing plant at Pottstown, Pa. So did the Union Pacific Railroad, at Omaha, Nebraska. Introduction of Robbins' process for smoking wood with the vapors of coal-tar and of creosote. Seeley patented pressure process for treating green timber with oleaginous and saline materials, and erected plants in New York, Chicago, and at the St. Clair Flats in Michigan, the United States Government using the process at the latter place for preserving the timbers along its canal. Burnettized ties used on the Lehigh & Susquehanna Railroad. W. H. Smith encased timber in vitrified earthenware pipes, and filled in with hydraulic cement.

1868. Seeley patented an open-tank process for treating green timber with creosote oil. Beer washed out the sap from wood with a solution of boiling borax.

1869. Louisville & Nashville Railroad treated stringers and piles with the Bethell Process.

1870. Thilmann used sulphate of copper or sulphate of zinc and chloride of barium in treating ties for the Baltimore & Ohio, Wabash, New York, Pennsylvania & Ohio, Lake Shore & Michigan Southern, Cleveland & Pittsburgh and other railroads.

1871. Thomas immersed wood in rosin oil. Webb bored holes in the wood and filled them with creosote.

1872. Fletcher boiled in coal-tar creosote some cypress paving blocks which were laid in New Orleans, La.] Constant and Smith tried to preserve wood by smoking it with vapors of coal-tar in a retort. Detwiler and Van Gilder impregnated wood with rosin dissolved in naphtha under pressure.

1874. Rutgers introduced in Germany a method of treating ties with a mixture of zinc chloride and creosote.

1875. Louisville & Nashville Railroad built a Bethell plant at West Pascagoula, La., to treat piles, stringers and ties. This plant laid the foundation for modern timber-treating in this country.

1876. Houston & Texas Central Railroad built a Bethell plant at Houston, Texas, to treat piles and timbers. Central Railroad of New Jersey installed cross-ties treated by the Bethell process.

1878. Commercial creosoting plant opened at Long Island City, New York.

1879. Boulton patented a process to extract the moisture from wood and simultaneously inject creosote. New Orleans & North Eastern Railroad built a pressure plant to treat with creosote, at Slidell, La., the timber to be used for a trestle across Lake Ponchartrain. Wellhouse employed zinc chloride, glue and tannin for preserving wood. Commercial creosoting plant built at Slidell, La.

1880. Houston & Tennessee Central Railway installed ties treated by the Bethell process. Pine piles treated by the Thilmany process used at Norfolk, Va.

1881. Commercial creosoting plant erected at Portsmouth, Va.

1882. Fladd patented process of impregnating freshly-cut wood with copper sulphate and other chemicals by suction.

1883. Hagen used gypsum as a plug for zinc-chloride treated wood.

1884. Boston & Maine Railroad installed Kyanized ties. Commercial creosoting plant erected at Seattle, Wash. Vulcanized pine ties laid on the Manhattan Elevated Railroad in New York City.

1885. Atchison, Topeka & Santa Fe Railroad built a Burnettizing plant at Los Vegas, New Mexico.

1886. Chicago, Rock Island & Pacific and the Union Pacific railroads used ties treated by the Wellhouse process. Lehigh Valley Railroad installed ties treated by the Bethell process.

1887. Southern Pacific Railway (Atlantic System) began treating Texas pine ties by the Burnett process at a leased plant.

1888. New Orleans Wood-Preserving Company erected a plant at New Orleans, La., to treat ties by the Burnett process, and piles and lumber by creosoting, for Texas & New Orleans Railroad.

— 1889. Southern Pacific Railway built a plant at West Oakland, Cal., employing either the Bethell or Curtis & Isaacs creosoting processes for treating ties and piles.

1890. Texas & New Orleans Railroad built a Bethell plant at Houston, Texas.

1891. Southern Pacific Railway (Atlantic System) built a Burnettizing plant at Houston, Texas. The D. & I. Railroad used ties treated by the Wellhouse process.

1892. Commercial Burnettizing plant built at Beaumont, Texas, and a commercial Bethell plant erected at the same place.

1893. Southern Pacific Railway (Pacific System) erected a portable Burnettizing plant for treating ties at Latham, Oregon.

1895. Louisville & Nashville Railroad put up a treating plant at Gautier, Miss., which was rebuilt in 1916. Commercial creosoting plants were built at Bay City, Mich., and Lowell, Wash.

1896. Pennsylvania Lines West installed ties treated by the Wellhouse process. Commercial creosoting plant was erected at Buell near Norfolk, Va.

1897. Atchison, Topeka & Santa Fe Railway built Burnettizing plants at Somerville, Tex., and at Bellemont, Arizona. Hasselman patented process for injecting into wood a solution of iron and aluminum sulphate, adding kainit to neutralize the free acids formed.

1899. Chicago, Burlington & Quincy Railroad erected a Burnettizing plant for treating ties at Sheridan, Wyoming. Chicago & Eastern Illinois Railroad used the Wellhouse process for treating ties. Commercial plant using the Burnettizing and Allardyce processes erected at Mt. Vernon, Illinois. Commercial plant vulcanizing ties removed from New York City to Perth Amboy, N. J., later using the creo-resinate process, and in 1906 transferred to Norfolk, Va.

1900. Chicago & Alton Railroad used Burnettized and creosoted ties and timbers.

1901. Great Northern Railway built a plant at Somers, Mont., to treat ties by Burnettizing. Missouri, Kansas & Texas Railroad used the Wellhouse process for treating ties at Greenville, Texas. Mexican Central Railway built a Burnettizing plant at Aguas Calientes, Mexico, to treat ties. Commercial creosoting plant erected at Southport near New Orleans, La., and one at Norfolk, Va. A non-pressure wood-preserving plant erected at Portland, Oregon. Bevier invented creo-resinate process.

1902. Rueping patented the injection of compressed air into wood ahead of creosote. El Paso & Southwestern Railroad erected a creosoting plant at Alamogorda, N. M., for treating paving blocks, wooden pipe and crossing plank. Chicago, Burlington & Quincy Railroad tried the Hasselman process. Commercial plants using various processes erected at Carbondale, Ill., and at Texarkana, Arkansas.

1903. Union Pacific Railroad erected a Burnettizing plant at Laramie, Wyo., for treating ties, telegraph poles, dimension timbers and crossing plank. Chicago & Northwestern Railway built a plant at Escanaba, Mich., for treating ties, using first the Wellhouse, then the Card and now the Burnett processes. Grand Trunk and Wabash Railroads installed Burnettized cross-ties. Commercial creosoting plant erected at Indianapolis, Ind., and one for using various processes built at Cimarron, N. M. Guissani open-tank process promoted in New York.

1904. Von Schrenk revived the Seeley open-tank process at the Exposition in St. Louis, Mo. Rueping took out United States patents. Oregon-Washington Railroad & Navigation Company erected a creosoting plant at Wyeth, Oregon, for treating ties, piles, switch-ties, dimension timbers, and paving blocks. Chicago, Milwaukee & St. Paul Railroad employed the Rueping process. The Big Four (Cleveland, Cincinnati, Chicago & St. Louis Railroad) used ties treated with creosote by a commercial wood-preserving plant at Shirley, Indiana. Kansas City Southern Railroad installed Burnettized cross-ties. Commercial plants for treating wood by various processes were erected at Grenada, Miss., Sandstone, Minn., and Terre Haute, Indiana. Organization of the Wood-Preservers' Association (changed to American Wood-Preservers' Association in 1912).

→ 1905. Lowry patented pressure process, using creosote with quick final vacuum. The first plant to use the Lowry process was erected at Shirley, Indiana. St. Louis & Southwestern Railroad used zinc-creosote treated ties, and the T., St. L. & W. Railroad Burnettized cross-ties. Delaware, Lackawanna & Western Railroad installed creosoted bridge-ties. Salt Lake & San Francisco Railroad installed ties treated by the Rueping process. Commercial plant using Bethell process erected at Maurer, N. J. Other commercial creosoting plants were built at Galveston, Tex., and Minneapolis, Minn.

1906. Card invented an improvement on the zinc chloride-creosote process. Atchison, Topeka & Santa Fe Railway erected a creosoting plant at Somerville, Tex. Kansas City Southern Railroad used creosoted cross-ties. Commercial creosoting plants were erected at Gulfport, Miss., Winnfield, La., Eagle Harbor, Wash., and Newark, N. J., and a plant employing the Card process was built at Waukegan, Illinois.

1907. Northern Pacific Railway erected Lowry plants at Brainerd, Minn., and at Paradise, Montana. Florida East Coast Railroad installed creosoted cross-ties. Lowry plants were erected at Marion, Ill., Bloomington, Ind., Springfield, Mo., Kansas City, Mo., and Hugo, Oklahoma. Atchison, Topeka & Santa Fe Railway built a crude oil plant at Albuquerque, N. M., which was later used for creosoting. Commercial plants using various processes were erected at Argenta, Ark., Evansville, Ind., and Buell, Va. A commercial creosoting plant was built at Mobile, Alabama. The Chicago, Burlington & Quincy Railroad erected a plant at Galesburg, Ill., for treating ties and timbers with either creosote, or zinc chloride, or both in combination. Delaware, Lackawanna & Western Railroad built a non-pressure plant at Nanticoke, Pa., and the Philadelphia & Reading Coal and Iron Company a similar one at New Philadelphia, Pa. The United States Government operated non-pressure plants at Keokuk, Iowa, Milan, Ill., Stillwater, Minn., and Fountain City, Wis.

1908. San Pedro, Los Angeles & Salt Lake Railroad erected a plant at San Pedro, Cal., to use either the Burnett or creosoting processes.

Bunker Hill & Sullivan Mining Company built a creosoting plant at Kellogg, Idaho. A commercial Bethell plant was erected at Atlanta, Georgia. A Lowry process plant was put in operation at Brainerd, Minn., by the Northern Pacific Railway.

1909. Tennessee Coal, Iron and Railroad Company built a non-pressure creosoting plant at McAdory, Alabama, for treating ties, telegraph poles, dimension timbers, and fence posts. Missouri, Kansas & Texas Railway built a Rueping plant at Dennison, Tex., for treating practically all kinds of timber. Union Pacific Railway built a Burnettizing plant at Topeka, Kansas. Pennsylvania Railroad erected a wood-preserving plant at Mt. Union, Pa. Commercial creosoting plants were erected at Bound Brook, N. J., Toledo, O., Paterson, N. J., and Columbus, Ohio. A commercial Burnettizing plant was built at Joppa, Ill., and a plant using various processes at Madison, Illinois.

1910. Pennsylvania Railroad erected a wood-preserving plant at Greenwich Point, Philadelphia, Pa. The Buffalo, Rochester & Pittsburgh Railroad built a Bethell plant at Bradford, Pa. Commercial creosoting plants erected at Shreveport, La., Rome, N. Y., Toledo, O., and Texarkana, Texas.

1911. A commercial creosoting plant erected at Ensley, Ala., and a plant for treating wood by various processes was built at Broadford Junction, Pa. The Pittsburgh & Lake Erie Railroad used creosoted ties.

1912. Philadelphia & Reading and Central Railroad of New Jersey erected a creosoting plant at Port Reading, N. J. Baltimore & Ohio Railroad built a Card process plant at Green Spring, W. Va. Atlantic Coast Line Railroad erected a Bethell plant at Gainesville, Florida. Central of Georgia Railroad put up a plant at Macon, Ga., to treat wood by the Card process. Charlotte Harbor & Northern Railroad built a creosoting plant at Hull, Florida. Commercial plants using various processes built at Terre Haute, Ind., Houston, Tex., Orrville, O., St. Helens, Oregon, Tacoma, Wash., Yardley, Wash., Pensacola, Fla., Louisville, Miss., Bogalusa, La., and Linnton near Portland, Oregon. Incorporation of the American Wood-Preservers' Association (formerly called Wood-Preservers' Association.)

1913. Louisville & Nashville Railroad erected a plant at Guthrie, Kentucky. Commercial creosoting plants built at Bay City, Mich., Metropolis, Ill., and Indianapolis, Ind.

1915. Chicago & Northwestern Railway erected a plant at Riverton, Wyo. Ties of the Chesapeake & Ohio, the Chesapeake & Ohio Northern and the Hocking Valley Railroads treated at a commercial Lowry plant at Russell, Ky. A commercial plant erected at Brunswick, Georgia.

1916. Boston Elevated Railway erected a creosoting plant at South Boston, Mass. A commercial creosoting plant built at Seattle, Wash.

PROGRESS IN WOOD PRESERVATION.

The growth of the wood-preserving industry in the United States, begun in an experimental way in 1832, has been rapid. At first Kyan's process of treating wood with bichloride of mercury was used, but real progress in wood preservation in this country did not begin until about 1838, when Burnett's zinc-chloride process and Bethell's coal-tar-creosote process for protecting wood against decay were introduced. Many other processes for preserving wood have been tried on a commercial scale with varying success, and manufacturers of machinery and supplies have made improvements that have made possible more economical operation of timber-treating plants. The merits of treated wood, notably its durability and economy in service, are also better known, and consumption is on the increase.

Undoubtedly the greatest impetus given to the wood-preserving industry in this country has been the advancing cost of timber, due to its wasteful consumption and increasing scarcity. At first the demand for treated wood was confined to comparatively few forms and kinds of material, because there was a large supply of cheap and durable timbers to be had, and as the equipment of the treating plant was expensive and the success of the processes considered uncertain, the early growth of wood preservation was slow.

Only 15 plants were in operation in the United States in 1895, but since then the number has rapidly increased. In 1914 there were 122 plants, of which 94 were in operation and reported an output of 159,582,639 cubic feet of treated timber, comprising railroad ties, piles, poles, paving blocks, structural timbers, cross-arms, lumber and miscellaneous kinds of wood. In 1915 the United States had no less than 127 plants of all kinds, and of these 102 were active, reporting a total output of 141,858,963 cubic feet of treated material. The accompanying table and diagrams will give some idea of the growth in output of treated timber in the United States from 1909 to 1915 inclusive.

The majority of the wood-preserving plants in the United States are of the pressure type; that is, the preservative solution is forced into the wood by means of pumps. Sixty-four of the plants in operation in 1915 were so-called commercial plants, which treat wood by contract, 30 were operated by railroads, and eight were owned by mining companies and municipalities. The location of these plants is shown on the map on page 21.

In 1915 the quantity of miscellaneous lumber treated in the Atlantic Coast Region exceeded that of any other region. There were treated in that year: 7,428,938 cross-ties; 3,500,821 linear feet of piles; 11,697 poles; 552,095 square yards of paving blocks; 28,298,805 board feet of construction timber; 16,757 cross-arms; 4,634,655 board feet of miscellaneous lumber. The preservatives used in this region in 1915 were: Creosote, 30,236,615 gallons; zinc-chloride, 2,077,877 pounds; other

preservatives, 50,080 gallons. During the year 1915 there were 20 plants in operation in this region.

In the Southern Coast Region, the 27 plants in operation during 1915 held the lead in the quantity of construction timber treated. The output for that year was: Construction timber, 77,798,523 board feet; cross-ties, 8,958,293; piles, 3,817,927 linear feet; poles, 66,216; paving blocks, 806,968 square yards; cross-arms, 121,945; miscellaneous lumber, 3,658,227 board feet. Of creosote there was used during the year 25,854,013 gallons, and of zinc-chloride, 9,767,867 pounds.

The Interior Eastern Region led in the quantity of paving material handled, and showed the largest consumption of miscellaneous preservatives. The output of the 29 plants reporting in 1915 was: 14,650,302 cross-ties; 138,639 linear feet of piles; 32,503 poles; 1,509,755 square yards of paving blocks; 18,914,931 board feet of construction timber; 2,211 cross-arms; and 1,809,064 board feet of miscellaneous lumber. Of preservatives there were used 22,333,674 gallons of creosote, 12,764,798 pounds of zinc-chloride, and 1,640,102 gallons other preservatives.

In the Interior Western Region, where 10 plants were in operation in 1915, the output was as follows: Cross-ties, 4,001,878; piles, 3,010

linear feet; poles, 3,107; paving blocks, 1,000 square yards; construction timber, 6,628,575 board feet; cross-arms, 56; miscellaneous lumber, 3,398,959 board feet. Of creosote there was used in 1915 a total of 2,395,411 gallons, and of zinc-chloride, 6,441,138 pounds.

The Pacific Coast Region had 16 plants in operation which reported the following output during 1915: Cross-ties, 2,046,177; piles, 1,848,022 linear feet; poles, 12,116; paving blocks, 66,552 square yards; construction timber, 10,368,207 board feet; cross-arms, 5,250; miscellaneous lumber, 436,604 board feet. The preservatives used in treating this timber were: Creosote, 3,245,292 gallons; zinc-chloride, 2,217,924 pounds; other preservatives, 3,362 gallons.

The output of the 102 plants in operation in the United States during 1915 was as follows:

Cross-ties	37,085,585	pieces.
Piles	9,308,419	linear feet.
Poles	125,939	pieces.
Paving Blocks	2,936,370	square yards.
Construction Timber	142,009,041	board feet.
Cross-arms	146,219	pieces.
Miscellaneous Lumber	13,937,509	board feet.

Total equivalent to..141,858,963 cubic feet.

The preservatives consumed in 1915 were as below:

Creosote (Foreign)	37,501,007	gallons.
" (Domestic)	43,358,435	"
Total	80,859,442	"
Zinc-chloride	33,269,604	pounds.
Other Preservatives	1,693,544	gallons.

In view of the fact that the railroads are the largest users of preserved wood, it is of interest to see the kinds of cross-ties that made up the 37,085,585 treated in 1915, and also the preservative used for each kind of wood, as given in the table on page 19.

The influence of railway practice on the growth of the wood-preserving industry is illustrated in the following table, which shows that the increase in the number of plants operated has been coincident with the increase in the number of ties treated.

Preserve wood and conserve woodland.

CONVERTING FACTORS.

- To obtain the number of cross ties, divide figures shown by 3.
 To obtain the number of linear feet of piles, divide the figures shown by .6763.
 To obtain the number of linear feet of poles, divide the figures shown by .5868.
 To obtain the number of square yards of paving blocks, divide the figures shown by 2.625.
 To obtain the number of board feet of construction timbers, multiply the figures shown by 12.
 To obtain the number of cross-arms, divide the figures shown by .6198.
 To obtain the number of board feet of lumber and miscellaneous material, multiply the figures shown by 12.

Mileage of steam railroads from 1890 to 1914 from records of Interstate Commerce Commission.

Cross-ties used and treated from 1906 to 1911 from Census Reports.

Cross-ties used from 1860 to 1905 and from 1912 to 1915 estimated on basis of 300 ties per mile.

PROCESSES FOR PRESERVING WOOD.

Inventors have been busy for years endeavoring to find ways and means of protecting wood against decay and from destruction by fire. Although many demonstrations have been made to prove the merits of new processes or preservatives, comparatively few discoveries are ever commercial successes.

The processes of commercial importance are those that either coat a piece of wood with a superficial absorption of preservative, or impregnate the interior of a piece of wood with a preservative under pressure.

In the non-pressure processes the superficial coating of preservative is obtained by brushing or spraying it on, or by dipping or soaking the wood in tanks of the preservative. Where only small lots of material are to be treated and the treated wood will not be abraded or split through the coating of preservative, these processes are economical.

The pressure processes, used wherever large quantities of wood are treated, affect deep penetration of the preservative, thereby protecting the interior of a piece of wood against decay. The depth of penetration attainable is dependent upon a number of factors, chief among which are the kind of wood, the character of its growth, its condition as to seasoning and solidity, the method of treatment, and the preservative used.

The simplest and oldest form of wood preservation is to brush the preservative into the stick to be treated, repeating the application two or more times. A container to hold and in which to heat the preservative is generally necessary. The labor cost of such treatment is comparatively high.

Where wood is in place and brushing preservative on it is inconvenient, spraying it is sometimes adopted. The waste of preservative is against general use of this method of application. Dipping or steeping a piece of wood in open tanks of suitable size, filled with preservatives, will assure a superficial covering with preservative deeper than that to be had by simply brushing on the preservative. The wood is immersed in hot or cold preservative and left to soak up all that it will. Or it is sometimes kept in boiling preservative for several hours and then plunged into cold preservative. In some cases the wood is placed in closed cylinders and the preservative made hot, though no pump pressure is applied. The time of treatment varies greatly, but a hot bath of one to two hours followed by a cool bath of the same period is usually enough. The best results from non-pressure processes are had only when thoroughly-seasoned wood is used. A disadvantage of brush, spray, and open-tank treatment is the loss of preservative through evaporation.

The locations of many non-pressure plants are given on page 40. Details as to the erection of similar plants may be had from the manu-

facturers listed on page 35. Particulars as to methods of treatment may be had from the purveyors of preservatives listed on page 30.

The general method of impregnating wood with a preservative is in cylinders, which range in size from 72 inches in diameter and 42 feet long to 108 inches in diameter and 172 feet long. The preservative is forcibly injected into the wood by means of pumps.

The two leading preservatives used in the pressure processes are creosote and zinc chloride, either alone or together, and the absorption per cubic foot of wood treated varies from 2 to 20 pounds of creosote, and usually from 0.5 to 0.75 lb. dry zinc chloride. The maximum quantity of creosote is usually injected into piles and other marine timbers that are subject to attack of the teredo and other marine borers; in land situations where decay is the principal source of failure about one-half as much creosote is injected into the wood. Zinc chloride is best adapted to timber for use in arid or semi-arid regions, where precipitation is too low to leach out the preservative, and where low first cost is essential. The pressure processes are divided into:

(1). Full-Cell treatments, which force into and leave in wood practically all the preservative it will hold where penetrated, thereby giving maximum protection against decay for that depth of penetration; and

(2). Empty-Cell treatments, which aim to reduce materially the final retention of preservative, while not reducing the depth of penetration.

Either green or seasoned timber can be treated by the pressure processes. When green timber is put into the cylinder it is often seasoned by means of live steam, followed by a vacuum to dry the wood before treatment. A vacuum is also drawn at the end of the treatment to hasten the draining of the surplus from the cylinder and to dry the timber.

The better-known pressure processes used in the United States are:

Bethell.—(Full-Cell Process.)

Patented by John Bethell in England in 1838. Commonly used for the treatment of piles, poles, cross-arms, paving blocks, structural timbers, lumber, and ties. Consists essentially of the following steps:

- a. Preliminary vacuum one-half to one or more hours.
- b. Oil injected under pressure, maximum usually between 100 and 180 lbs. per square inch.
- c. Final vacuum (sometimes omitted).

Green timber is usually subjected to a live steam bath at about 20 lbs. pressure for several hours before the preliminary vacuum. Seasoned timber is not usually steamed in this process, except in the case of paving blocks. The amount of oil injected depends upon the specifi-

cations of the purchaser, but the absorption per cubic foot is usually within the following ranges:

Lumber, poles, structural timbers, cross-arms, ties, fresh-water and land piles, 8 to 12 pounds.

Paving blocks, 12 to 20 pounds.

Salt water piles, 16 to 24 pounds.

Boiling.

Patented by W. G. Curtis and John D. Isaacs in 1895 and reissued the same year. (U. S. patent 545,222, and reissue 11,515).

Used chiefly for creosoting Douglas fir piles, timber, lumber, ties, and paving blocks. Consists essentially of the following steps:

a. Wood (either green or seasoned) in the retort is covered with oil at about 160° F.

b. Oil heated to 225° to 250° F. at atmospheric pressure and vapors passed through a condenser.

c. Heating continued until rate of condensation falls to 1/6 to 1/10 of a pound of water per cubic foot of wood per hour. This frequently requires 40 to 60 hours for green timber, and sometimes more.

d. Retort filled with cool oil, allowing temperature to fall.

e. Pressure applied, maximum 120 to 150 lbs. per square inch, until desired absorption obtained; usually 10 to 12 lbs. per cubic foot.

Boulton.—(Boiling Under Vacuum.)

Patented by S. B. Boulton in England and the United States. (See U. S. patent 247,602, issued Sept. 27, 1881), also by O. P. M. Goss in the United States. (See U. S. patent 1,167,492, issued in 1916).

Used chiefly for the treatment of Douglas fir piles, timber, ties, lumber and paving blocks. Consists essentially of the following steps:

a. Timber immersed in hot creosote and subjected to a vacuum, and the escaping vapors drawn through a condenser.

b. Temperature (usually 190° F. to 210° F.) and vacuum maintained until the rate of condensation of water falls to a specified amount per cubic foot of wood per hour, usually 1/6 to 1/10 of a pound.

c. Vacuum discontinued and pressure applied until desired absorption obtained.

The object of the vacuum is to evaporate the water from the wood at a lower temperature than in the ordinary steaming or straight-boiling process.

Burnett.

Patented in England in 1838 by William Burnett.

In general use for treating ties, lumber and timber with zinc chloride. Consists essentially as follows for seasoned wood:

a. Preliminary vacuum.

b. Zinc chloride solution applied under pressure of 100 to 175 lbs. per square inch, to approximate refusal.

For green timber a steaming period of one to five or more hours at about 20 lbs. is usually applied before the vacuum. The strength of the zinc solution generally is so regulated that at refusal the timber will have absorbed from $\frac{1}{4}$ to $\frac{1}{2}$ lb., usually the latter, of dry zinc chloride per cubic foot.

Card.

Patented by J. B. Card in 1906, (U. S. patent 815,404). Used chiefly for ties, lumber, and timbers. The essential parts of the process are:

a. The use of a mixture containing about 80% of zinc chloride solution and 20% creosote.

b. The method of keeping the zinc chloride and creosote mixed during treatment by means of a rotary pump, which draws the mixture from the top of the retort and returns it at the bottom through a perforated pipe.

The use of steaming, vacuum, and pressure are the same as in the Bethell process. It is customary to inject about $\frac{1}{2}$ lb. of zinc chloride and 2 to 3 lbs. of creosote per cubic foot.

Lowry.—(Empty-Cell Process.)

Patented by C. B. Lowry in 1906. (U. S. patent 831,450). Used chiefly for creosoting air-seasoned cross-ties. Consists essentially of the following steps:

a. Without first drawing a vacuum, creosote at not to exceed 200° F. is injected into the wood to refusal, or to a specific amount.

b. A quick vacuum is drawn to remove the excess oil from the timber.

The air imprisoned by injecting the oil without a preliminary vacuum expands during the final vacuum, forcing out a certain amount of the oil with it. The process is classed as an empty-cell process for this reason. The net absorption is from 6-8 pounds per cubic foot.

Rueping.—(Empty-Cell Process.)

Patented in the United States in 1902 by Max Rueping. (U. S. patents 707,799 and 709,799). The second patent was reissued October, 1907. (Reissue 12,707).

Used chiefly for ties and lumber. Consists of the following steps:

a. Retort, containing the wood, is filled with compressed air; the pressure varying with the kind and condition of the wood.

b. Oil forced into retort, gradually allowing air to escape, but without reducing pressure.

c. When retort is full of oil, pressure is increased to a maximum of 150 to 200 lbs. per square inch, and held to refusal, or until specified absorption is obtained.

d. Oil drained and vacuum drawn to remove excess of oil from the wood.

If green timber is treated, it is first artificially seasoned by steaming, boiling, or boiling under vacuum, before the air pressure is applied. Net absorption usually 4 to 6 lbs. per cubic foot.

Steaming.—(*Colman Process.*)

Not patented.

Used almost exclusively for the treatment of Douglas fir piles. Consists essentially of the following steps:

a. Timber steamed at a pressure of 90 to 100 lbs. per square inch for 3 to 10 hours.

b. Steam released and vacuum drawn until timber is considered seasoned. This sometimes requires 18 to 20 hours. The temperature within the retort during the vacuum period is usually maintained above 200° F.

c. Oil is injected at a maximum pressure of 100 to 150 lbs. per square inch until desired absorption is obtained.

There are many other processes, the merits and demerits of which have been or are yet to be demonstrated. Most wood-preserving plants are equipped to treat by any processes desired by the user of the treated wood. They also may be relied upon to advise the kinds of treatments which will bring results to which they can point later with satisfaction.

Conservation by preservation is economy exemplified.

WOOD PRESERVATIVES.

The substances proposed as a means of protecting wood against destruction by fire, fungi, insects, or worms, include the following:

Aluminum sulphate.	Petroleum oils.
Animal oils.	Potassium carbonate.
Barium carbonate.	Potassium nitrate.
Barium sulphate.	Resins.
Borax.	Sodium carbonate.
Cedar oil.	Sodium chloride.
Copper sulphate.	Sodium fluoride.
Creosotes (coal-tar, water- gas-tar, wood, petroleum.)	Sodium muriate.
Crude oil.	Sodium sulphate.
Fish oil.	Sulphuric acid.
Glue.	Tannin.
Gums (various.)	Tar.
Iron sulphate.	Tartaric acid.
Lime hydrate.	Vegetable oils.
Linseed oil.	Wax.
Magnesium sulphate.	Whale oil.
Mercuric chloride.	Zinc chloride.
Molasses and low syrups.	Zinc sulphate.

The merit of a wood preservative is determined either by its ability to poison fungi or bacteria, or to waterproof wood. Preservatives vary greatly in their toxicity (property to poison), and the greater their toxicity the longer will the wood keep sound. Toxic preservatives that will easily penetrate wood, do not affect its strength, and are obtainable at a reasonable price, are the most efficient and economical.

The consumption of wood preservatives in the United States for a series of years is given in the accompanying table.

WOOD PRESERVATIVES USED IN THE UNITED STATES.

Year	Number of Plants	Creosote. Gallons.	Zinc Chloride. Pounds.	Other Preservatives. Gallons*.
1909	64	51,431,212	16,215,109	†
1910	71	63,266,271	16,802,532	2,333,707
1911	80	73,027,335	16,359,797	1,000,000
1912	84	83,666,490	20,751,711	3,072,462

*Includes crude oil, coke oven-tar, refined coal-tar and carbolineum oils.

†Statistics not available.

‡"Paving oil."

Some preservatives like zinc chloride, mercuric chloride, and copper sulphate, are made from inorganic compounds which are soluble in

water, and these will leach out of the wood when it is exposed to very wet surroundings. In dry localities, however, these inorganic preservatives will assure a considerably longer life to treated wood than could be expected of the untreated wood. Other preservatives, such as the creosotes, which are made from organic compounds, are more waterproof and less volatile.

Creosote.

The creosote suitable for preserving wood is derived from the tar obtained in the destructive distillation of wood, coal, petroleum, etc. Creosote oil, in the scientific sense, may be defined as any and all distillate oils boiling between 200° and 400° Centigrade, which are obtained by distillation from tars consisting principally of compounds belonging to the aromatic series and containing well-defined amounts of phenoloids.

Creosote is the most important wood preservative, and has been in use for this purpose for a great many years. The consumption of creosote oil in the United States in the five years from 1909 to 1913 more than doubled, and in the seven years from 1909 to 1915 was as follows:

CREOSOTE USED IN THE UNITED STATES.

Year	Total Creosote Used.	Domestic Creosote.	Per Cent of Total	Imported Creosote.	Per Cent of Total
	Gallons.	Gallons.		Gallons.	
1909	51,426,212	13,862,171	27	37,569,041	73
1910	63,266,271	18,184,355	29	45,081,916	71
1911	73,027,335	21,510,629	29	51,516,706	71
1912	83,666,490	31,135,195	37	52,531,295	63
1913	108,373,359	41,700,167	38	66,673,192	62
1914	79,334,606	28,026,870	35	51,307,736	65
1915	80,859,442	43,358,435*	54	37,501,007	46

*41,333,890 gals. coal-tar and 2,024,545 gals. water-gas-tar.

The domestic production of creosote oil has grown steadily, especially since the European war interfered with exports to the United States. In 1914 the production of creosote oil in the United States amounted to 28,026,870 gallons, and a year later had nearly doubled to 43,358,435 gallons. Domestic manufacturers furnished 35% of the total amount of creosote oil used in 1914, and in 1915 they supplied 54%. The imports in 1914 amounted to 65% of the total consumption of creosote oil in the United States, and in 1915 the foreign supply fell to 46%.

Specifications for coal-tar creosote oil, calculated on the basis of the dry oil when distilled by the common method (using an 8-oz. retort, asbestos covered, with standard thermometer, bulb $\frac{1}{2}$ in.

above the surface of the oil), prepared by the American Railway Engineering Association, are as follows:

Distillation	Grade 1.	Grade 2.	Grade 3.
Below 210° C.....	5%	8%	10%
" 235° C.....Not over	25%	35%	40%
Residue above 355° C. Over	5%—soft	5%—soft	5%—soft
Water	3%	3%	3%
Specific gravity at 38° C....	1.03	1.03	1.025

Grade 1 oil shall be a pure product obtained from coal-gas-tar or coke-oven-tar, and shall be free from any tar, including coal-gas-tar and coke-oven-tar, oil or residue obtained from petroleum or any other source; it shall be completely liquid at 38° C., and shall be free from suspended matter. Oils 2 and 3 shall be the best-obtainable grades of coal-tar creosote.

The specifications for creosote oil prepared in behalf of the American Society of Municipal Improvements in October, 1916, by that association's Committee on Standard Specifications for Creosoted Wood Block Paving, are as follows:

"A" Coal-Tar Paving Oil: A coal-tar product at least 65% a distillate of coal-gas tar or coke-oven tar; the remainder refined or filtered coal-gas tar or coke-oven tar.

"B" Coal-Tar Distillate Oil: A distillate of coal-gas tar or coke-oven tar.

	"A"	"B"
Water	Not more than 3%	Not more than 3%
Matter insoluble in benzol	Not more than 3%	Not more than 0.5%
Specific gravity at 38° C.	Between 1.07 and 1.12...	Not less than 1.06
Distillates		
Up to 210° C.....	Not over 5%	Not over 5%
Up to 235° C.....	Not over 25%	Not over 15%
Residue above 355° C...	If over 35% shall have float test of not over 80 sec. at 70° C.....	If over 10% shall have float test of not over 50 sec. at 70° C.
Specific gravity of fraction between 235° C and 315° C.....	Not less than 1.02 at 38°/15.5° C.....	Not less than 1.02 at 38°/15.5° C.
Specific gravity of fraction between 315° C and 355° C.....	Not less than 1.09 at 38°/15.5° C.....	Not less than 1.09 at 38°/15.5° C.
Coke residue	Not more than 10%	Not more than 2%

Zinc Chloride.

The principal water-soluble salt which is used as an antiseptic for destroying fungi that attack wood in localities that are not excessively wet is zinc chloride, which has been employed as a wood preservative for nearly forty years. It is purchased either in the fused state or in a concentrated solution. Fused zinc chloride should contain at least 94% of water-soluble chloride of zinc, and be free from acids. It should be practically free from soluble iron or other inorganic impurities insoluble in hydrochloric acid. The concentrated solution contains about 50% water, and this is the form in which zinc chloride is injected into wood. The consumption of zinc chloride in the United States for preserving wood amounted in 1914 to 27,212,259 pounds, and in 1915 to 33,269,604 pounds.

A number of patented, proprietary wood preservatives are being marketed. They are used generally in gallon or barrel lots in localities near their points of manufacture, to minimize the cost of their transportation.

Pavements of preserved wood
are pavements of permanent worth.

USES OF PRESERVED WOOD.

Wood has many advantages over its substitutes; namely:

Wood is widely distributed and easily obtainable.

Wood can be worked easily into any shape with simple tools.

Wood is strong, tough, elastic and noiseless.

Wood will not contract or expand under varying temperatures.

Wood is a non-conductor of heat and electricity.

Wood used in structures or for other purposes can be more easily removed and used over again than equally-substantial material.

Preservative treatment gives to wood the additional advantage of durability wherever decay is a factor in its service.

The principal uses of treated wood are:

Cross-Ties.	Cross-Arms.
Switch-Ties.	Fence Posts.
Bridge-Ties.	Blocks for Paving
Structural Timbers.	and Flooring.
Piles.	Miscellaneous Lumber.
Poles.	

One-third of all the railway ties used annually are now treated with preservatives, and the consumption of treated wood for railway work is steadily increasing.

Treated telegraph and telephone poles and cross-arms are now the rule rather than the exception. Only creosoted piles will withstand the attack of marine borers, and in consequence untreated wood is now rarely found in wharf supports.

Streets paved with wood blocks are no longer uncommon. Their growing popularity is justified by their wearability, noiselessness, dustlessness, etc.

As flooring, wood block is used in:

Foundries.	Ferryboats and Ap-	Rubber Factories.
Machine Shops (all	proaches.	Hospitals.
kinds).	Driveways.	Laundries.
Shops Handling	Bridges.	Printing Establish-
Heavy Machinery.	Post Offices.	ments.
Railway Shops.	Dumping Platforms.	Garages.
Railway Stations.	Freight Platforms.	Cotton Mills.
Warehouses.	Loading Platforms.	Paper Mills.
Factories.	Station Platforms.	Kitchens.
Factory Courts.	Wharves and Docks.	Bakeries.
Freight Houses.	Barns.	Engine Houses.
Express Rooms.	Tennis Courts.	Milk Depots.
Baggage Rooms.	Stables.	Breweries.
Wild Animal Cages,	Slaughter Houses.	Dairies.
Runways, etc.		

Satisfied users replied as follows when asked why they preferred wood block as flooring:

- Wears well; durable; long life.
- Easy on feet of workmen; men like to work on these floors.
- Quiet; noiseless.
- Easily repaired.
- Low upkeep cost.
- Smooth, easy trucking; good surface.
- Good footing. Not slippery.
- Saves tools dropped, castings, fine work, materials, kegs, etc.
- Sanitary.
- Warm.
- Dustless; clean.
- Easily cleaned.
- Resilient, pliable, shock absorber.
- Easy on mules and horses.
- Easy to move or set up machinery on, to put in pipes, etc.
- Saves trucks.
- Non-inflammable.
- Stands great abuse.
- Dries quickly; waterproof.
- Makes a solid floor.
- Non-absorbent.
- Does not crack or chip when heavy castings are thrown on floor.
- Makes a neat floor.
- Keeps a neat floor.
- Keeps out flies, mosquitoes, etc.
- Not damaged by metal grinding into the floor.
- Easily laid.

Preserved structural timbers and miscellaneous lumber are used for numerous purposes about the farm, in silos, barns, stock pens, chicken coops, fencing, culverts, etc.; about mills, as sills, posts, rafters, conduits, etc.; in mines, as supports, etc.

Preserved piles are practically permanent.

Treated ties typify tip-top track.

USERS OF PRESERVED WOOD.

With a wider knowledge of the merits of treated wood for many purposes, and its greater economy as compared with the natural product, has come a more liberal demand for treated wood, especially from the larger users of this material. To name every user of treated wood would be quite a task, but it is possible to give some idea of the industries that absorb the increasing supply, as mentioned below :

Treated Cross-Ties, Switch-Ties and Bridge Ties.

Railroad companies.

Treated Structural Timbers.

Manufacturing companies.

Mining companies.

Railroad companies.

Agriculturists.

Treated Piles.

Railroad companies.

Shipbuilding companies.

Dock companies.

U. S. Government.

Municipalities.

Treated Poles and Cross-Arms.

Telegraph companies.

Telephone companies.

Railroad companies.

Light companies.

Power companies.

Water supply companies.

Treated Fence Posts.

Railroad companies.

Agriculturists.

Treated Miscellaneous Lumber.

Railroad companies.

Agriculturists.

Shipbuilding companies.

Treated Wood Blocks.

Railroad companies.

Express companies.

Manufacturing companies.

Foundries.

Machine shops.

Post offices.

Garages.

Dock companies.

MEXICO.

No data regarding treating plants in Mexico. The Mexican Central Railroad built a plant at Aguas Calientes, Mex., in 1901 to treat railroad ties with chloride of zinc. About the year 1907 the Madero Co. built a 2-retort plant at Madera, Chihuahua, Mex., to treat railroad ties with chloride of zinc.

AMERICAN WOOD-PRESERVERS' ASSOCIATION CONSTITUTION

(Amended 1912, 1915, 1916)

ARTICLE I.

Name and Objects.

SECTION 1. The name of this Association shall be the AMERICAN WOOD-PRESERVERS' ASSOCIATION.

SECTION 2. The objects of the Association shall be the promotion of knowledge of the materials, methods, and principles involved in the economic design, location, construction, maintenance, and operation of wood-preserving works; the standardization of specifications for wood preservatives and for their introduction into the material to be preserved; and the maintenance of high standards of business ethics in the wood-preserving industry.

SECTION 3. The means to be used for these purposes shall be meetings for the presentation and discussion of reports of the experiences and investigations of its members and others, for the interchange of ideas, and for social intercourse; the publication of desirable information; and co-operation with organizations or individuals in work affecting wood-preserving.

ARTICLE II.

Membership.

SECTION 1. The Association shall consist of Corporate, Associate, Probate, and Honorary members.

SECTION 2. A Corporate Member shall be an executive, an administrator, or an operative in a wood-preserving organization; an officer of a public-utility corporation using treated wood whose duties cover the purchasing, inspecting, treating, or distribution of such material; a chemist or an engineer in the employ of a city, county, state, nation, or public-utility corporation; a consulting chemical, civil, electrical, forest, or mechanical engineer; or a professor or an instructor in an institution of learning.

SECTION 3. An Associate Member shall be any person or association of persons interested in wood preservation or in the sale of material or equipment used in the wood-preserving industry.

SECTION 4. A Probate Member shall be an employe of a wood-preserving or inspecting organization who is not eligible for Corporate Membership.

SECTION 5. An Honorary Member shall be a person of acknowledged eminence in the wood-preserving industry or the sciences relating thereto. The number of Honorary Members shall not exceed five.

SECTION 6. Corporate Members shall have all the rights and privileges of the Association.

SECTION 7. Associate Members shall have all the rights of Corporate Members, except those of voting or holding office.

SECTION 8. Probate Members shall have all the rights of Corporate Members, except those of voting or holding office, for five years from the date of their admission, when their status shall be determined by the Executive Committee.

SECTION 9. Honorary Members shall have all the rights of Corporate Members, except that of holding office, and shall be exempt from the payment of dues.

ARTICLE III.

Admissions and Expulsions.

SECTION 1. Applications for membership and resignations from membership shall be transmitted to the Secretary-Treasurer, the former on a form prescribed by the Executive Committee and endorsed by a Corporate or an Honorary Member. The Secretary-Treasurer shall forward a copy of each application for membership to each member of the Executive Committee, the affirmative votes of a majority of whom shall admit the candidate.

SECTION 2. Proposals for Honorary Membership shall be made by at least ten members, none of whom shall be a member of the Executive Committee. The nominee shall be declared an Honorary Member if he receives the unanimous vote of the Executive Committee or the votes of two-thirds of the Corporate and Honorary members.

SECTION 3. Any member of the Association who resigns while in good standing may be reinstated without paying a second admission fee, provided his application is approved by two-thirds of the Executive Committee.

SECTION 4. For unbecoming conduct a member may be expelled by the votes of two-thirds of the members at an Annual Meeting, after the member has been served with written particulars as to his offense by the Executive Committee, and had an opportunity to be heard by it or by the members at an Annual Meeting.

SECTION 5. The Executive Committee shall accept the resignation, tendered in writing, of any member whose dues are paid.

ARTICLE IV.

Dues.

SECTION 1. On admission to the Association, members shall pay fees as follows: Corporate Members, \$10.00; Associate Members, \$15.00; Probate Members, \$5.00, which shall include their first dues.

SECTION 2. The annual dues, payable during the first two months of the calendar year, shall be as follows: Corporate Members, \$10.00; Associate Members, \$10.00; Probate Members, \$5.00.

SECTION 3. Members admitted after March 31 shall be exempt from the payment of dues until the following January 1, unless they desire to vote or to receive the current publications of the Association, in which case they shall pay one-half of the annual dues.

SECTION 4. Any member whose dues are unpaid on April 1 shall not receive the publications of the Association, and if his dues are not paid by December 31, his membership shall be canceled, except as provided for in Section 5 of this Article.

SECTION 5. The Executive Committee may extend the time for paying or remit the dues of any Corporate or Probate members who are unable to pay them.

ARTICLE V.

Officers.

SECTION 1. The officers of the Association shall be Corporate Members and shall consist of a President, a First Vice-President, a Second Vice-President, a Secretary-Treasurer, and six Members of Executive Committee, who, together with the last Past-President who is a Corporate Member, shall constitute the Executive Committee in which responsibility for the government of the Association shall be vested. The President shall be chosen from the nine eligible members of the Executive Committee.

SECTION 2. No two or more officers in any year shall be members of the same business organization.

SECTION 3. The President, the First Vice-President, the Second Vice-President, the Secretary-Treasurer, and two Members of Executive Committee shall be elected at each Annual Meeting.

SECTION 4. The terms of the President, Vice-Presidents, and Secretary-Treasurer shall begin at the close of the Annual Meeting at which they are elected and continue until their successors are elected and have qualified. The six Members of Executive Committee shall serve three years, two being elected each year.

SECTION 5. A vacancy in the office of President shall be filled by the Vice-Presidents in order.

SECTION 6. A vacancy in any office other than that of President shall be filled by an appointee of the Executive Committee.

SECTION 7. The President shall not be eligible for re-election to that office until three others have filled it. A Vice-President shall not be eligible for re-election to the same office until one other has filled it.

ARTICLE VI.

Nomination and Election of Officers.

SECTION 1. At each Annual Meeting six Corporate Members who are not officers shall be elected, together with the three last Past-Presidents who are Corporate Members, to serve one year as a Nominating Committee, of which the senior Past-President shall be chairman.

SECTION 2. The Nominating Committee shall nominate one eligible member for each office and for each membership in the Nominating Committee and shall send its list of nominees to the Secretary-Treasurer before October 15. Any vacancies that may occur in the list of nominees before it is sent to the members shall be filled by the Executive Committee.

SECTION 3. The voting shall not be restricted to the names presented by the Nominating Committee. Any member may file with the Secretary-Treasurer before November 1 the name of a candidate for any office.

SECTION 4. The ballot, with envelopes for secret voting, shall be sent to each member before December 1. It must contain the names of all nominees for each office, arranged alphabetically where there is more than one name for any office, with the nominees of the Nominating Committee plainly indicated.

SECTION 5. Members may scratch or substitute the name of any nominee for any office.

SECTION 6. Ballots shall be sealed and sent or delivered to the Secretary-Treasurer before the polls close, prior to which time a voter may withdraw or replace his ballot.

SECTION 7. The polls shall be closed at noon on the first day of the Annual Meeting, and the ballots shall be counted by one Corporate and four Associate or Probate Members, appointed tellers by the presiding officer at the Annual Meeting.

SECTION 8. The persons who receive the highest number of votes for the offices for which they are candidates shall be declared elected. In case of a tie between candidates for the same office, the members present at the Annual Meeting shall elect the officer from the candidates so tied. The presiding officer shall announce to the meeting the names of the officers elected.

ARTICLE VII.

Management.

SECTION 1. The President shall have general supervision of the affairs of the Association, shall preside at its meetings and those of the Executive Committee, and shall be a member *ex-officio* of every committee except the Nominating Committee.

SECTION 2. The Vice-Presidents, in order of seniority, shall preside at meetings in the absence of the President, and discharge his duties in case of a vacancy in the office.

SECTION 3. The Secretary-Treasurer, under the direction of the President and the Executive Committee, shall be the executive officer of the Association. He shall conduct the correspondence of the Association; record the proceedings of all meetings; collect and deposit all moneys due the Association; verify all bills and pay them when approved by the President or Executive Committee; make at each Annual Meeting a report of the accounts and membership of the Association; and perform such other duties as may be assigned to him by the Executive Committee.

SECTION 4. The Executive Committee shall manage the affairs of the Association, and shall have full power to control and regulate all matters not provided for in the Constitution. It shall act on applications for membership; make appropriations for specific purposes; direct the care of the surplus funds of the Association; and audit the accounts of the Secretary-Treasurer.

SECTION 5. The Executive Committee shall publish the activities of the Association in a book to be known as the Annual Proceedings; but, subject to the action of the Association, it may withhold, in whole or in part, discussions, papers, or reports, the propriety or soundness of which it considers questionable.

SECTION 6. The Executive Committee shall have printed a Manual of Recommended Practice, in which shall be published the specifications and standards approved by the Association in accordance with Article X.

SECTION 7. The Executive Committee shall meet at such times and places as the President may direct, or five members may request in writing. Six members shall constitute a quorum.

ARTICLE VIII.

Meetings.

SECTION 1. An Annual Meeting, at which the officers shall be elected and all annual reports read, shall be held on the fourth Tuesday in January of each year, at ten o'clock A. M., at such place as the Association at the previous meeting may designate.

SECTION 2. Whenever the President may deem it necessary, or upon the written application of fifteen Corporate Members, he shall direct the Secretary-Treasurer to call a special meeting. The call for such a meeting shall state the time, place, and purpose of the meeting, and shall be mailed not less than thirty days prior to the date of the proposed meeting.

SECTION 3. Twenty Corporate Members shall constitute a quorum at any meeting of the Association.

SECTION 4. The order of business at the meetings of the Association shall be arranged by the Executive Committee, subject to addition or change by the votes of the majority of the members present.

ARTICLE IX.

Amendments.

SECTION 1. Proposed amendments to this Constitution must be offered in writing, signed by at least five Corporate Members, and forwarded to the Secretary-Treasurer not less than thirty days prior to the Annual Meeting. They shall be published with the notices for the meeting.

SECTION 2. Proposed amendments shall be in order for discussion at the Annual Meeting, and may be amended and adopted if two-thirds of the votes of the Corporate and Honorary members present and voting are affirmative.

ARTICLE X.

Adoption of Standards.

SECTION 1. Any proposals for the approval or recommendation by the Association, of definitions, methods, nomenclature, specifications, standard construction, or standard practice, or aimed at defining formally the position of the Association on any matter of importance, shall be presented in writing, with drawings if necessary, at an Annual Meeting. At this meeting amendments may be made by a majority of the Corporate and Honorary members present and voting. Proposed standards shall be referred to letter ballot of the Association if two-thirds of the Corporate and Honorary members at an Annual Meeting vote affirmatively. The affirmative votes of two-thirds of all the Corporate and Honorary members shall be required for the adoption of any standard.

AMERICAN WOOD-PRESERVERS' ASSOCIATION OFFICERS AND COMMITTEES

OFFICERS FOR 1916.

Carl G. Crawford.....President
 John Foley.....First Vice-President
 M. K. Trumbull.....Second Vice-President
 F. J. Angier.....Secretary-Treasurer, Mt. Royal Station, Baltimore, Md.

EXECUTIVE COMMITTEE.

Carl G. Crawford, *Chairman*
 Angier, F. J. }
 Foley, John } Term, 2 Years
 Trumbull, M. K. }
 Joyce, A. R. }
 Pooler, F. S. } Term, 3 Years
 Davidson, G. M. }
 Rex, Geo. E. }
 Card, J. B. } Term, 1 Year
 Hendricks, V. K. }
 Waterman, J. H. }

STANDING COMMITTEES FOR 1916.

No. 1—Preservatives.

E. B. Fulks, *Chairman*
 Acree, S. F. }
 Church, S. R. }
 Forrest, C. N. }
 Fulweiler, W. H. }
 Kammerer, A. L. }
 Larkin, A. E. }
 Steinmayer, O. C.
 Taylor, C. M.

No. 2—Specifications for the Purchase and Preservation of Treatable Timber

A. R. Joyce, *Chairman*
 Card, J. B. }
 Goss, O. P. M. }
 Martin, F. R. }
 Rex, Geo. E. }
 Winslow, C. P. }
 Smith, Lowry
 Sterling, E. A.

No. 3—Wood Block Paving.

C. H. Teesdale, *Chairman*
 Buehler, Walter }
 Cherrington, F. W. }
 Hamilton, F. P. }
 Loud, H. S. }
 Newton, H. M.

No. 4—Plant Operation.

A. L. Kuehn, *Chairman*
 Hunt, Geo. M. }
 Lane, C. W. }
 Lockett, A. M. }
 McArdle, Frank }
 Meyer, August

No. 5—Service Tests of Ties and Structural Timber.

C. P. Winslow, *Chairman*
 Bowser, E. H. }
 Ford, C. F. }
 Gosline, C. E. }
 Mattos, F. D. }
 Rollins, H. M.
 von Schrenk, Hermann

No. 6—Service Tests of Wood Block Paving.

AMERICAN WOOD-PRESERVERS' ASSOCIATION MEMBERS

c-Corporate. a-Associate. p-Probate. h-Honorary.
Figures indicate serial number of Membership Certificates.

- 324 c ACREE, S. F.....In Charge Section of Derived Products, Forest Product Laboratory, Madison Wis.
- 183 c ALEXANDER, E. E.....General Foreman, Timber Preserving Plant, Baltimore and Ohio R. R. Co., Green Spring, W. Va.
- 29 c ALLARDYCE, R. L.....Supt., International Creosoting & Construction Co., Texarkana, Tex.
- 21 c ALLERTON, DAVID.....Carlotta, Cal.
- 1 c ANGIER, F. J.....Supt. of Timber Preservation, Baltimore and Ohio R. R. Co., Baltimore, Md.
- 274 c APPEL, HARRIS A.....Engineer, Bruno Grosche & Co., 90 Wall Street, N. Y.
- 2 c ARMSTRONG, R. L.....636 Burdette St., New Orleans, La.
- 105 c BACON, W. L.....Supt. Tie Treating Plant, C. & N. W. Ry., Escanaba, Mich.
- 225 c BAKER, HUGH P.....Dean, New York State College of Forestry, Syracuse, N. Y.
- 3 h BAKER, J. S.....Box 22, Paducah, Ky.
- 167 c BATEMAN, ERNEST.....Chemist, Forest Products Laboratory, Madison, Wis.
- 246 c BATES, JOHN S.....Supt., Forest Products Laboratories, McGill University, Montreal, Canada.
- 88 c BATSON, C. D.....Manager, Republic Creosoting Co., Mobile, Ala.
- 4 c BEAL, F. D.....Sales Engineer, Chas. R. McCormick & Co., 800 Fife Bldg., San Francisco, Cal.
- 255 c BEATY, R. ERNEST.....Expert on Wood Preservation, 30 Church St., New York.
- 198 c BECKER, A. C.....Chief Tie & Timber Inspector, Grand Trunk Ry., Montreal, Canada.
- 295 a BELANGER, ERNEST....Consulting Engineer, Elder Ebano Asphalt Co., 364 University St., Montreal, Canada.
- 145 c BELCHER, R. S.....Supt. Treating Plant, Santa Fe Tie & Lumber Pres. Co., Somerville, Tex.
- 144 c BERK, P. F.....Chemical Mfr., F. W. Berk & Co., Ltd., 1 Fenchurch Ave. London, England.
- 5 h BERRY, C. W.....Consulting Engineer, care of J. B. Berry, Transportation Bldg., Chicago, Ill.
- 300 c BLACK, JAMES M.....Paving Block Expert, 203 Pasadena Apts., Jefferson & Du Bois Sts., Detroit, Mich.
- 22 c BOEHNE, E. E.....Office Manager, International Creosoting & Construction Co., Galveston, Tex.
- 258 c BOOK, J. E.....Treating Engineer, Pacific Creosoting Co., Creosote, Wash.
- 244 c BOWSER, E. H.....Supt. of Timber Department, I. C. R. R., Memphis, Tenn.
- 267 a BOYD, J. L.....Chief Engineer Creosoted Block Paving Co., Royal Bank Bldg., Toronto, Canada.
- 280 p BRENNAN, T. S.....Lumber Inspector, A. T. & S. F. Ry., Box 503, Ballard Station, Seattle, Wash.
- 301 c BRIGHT, EDGAR W.....Tie & Timber Agent, Boston Elevated Rwy. Co., 101 Milk St., Boston, Mass.
- 340 c BROWN, F. I.....Lumber Agent, Pennsylvania Lines West, Fort Wayne, Ind.
- 230 c BROWN, NELSON C.....Professor of Forest Utilization, New York State College of Forestry, Syracuse, N. Y.
- 122 c BRUNING, HEINRICH...(Robert A. Munro & Co., 31 Liberty St., New York City) Hubertsmuhle, Schopf furth, Mark, Germany.
- 23 c BUEHLER, WALTER....Consulting Engineer on Wood Preservation, The Barrett Co., 10 S. La Salle St., Chicago, Ill.
- 24 c BURKHALTER, D.....American Creosoting Co., Box 77, Russell, Ky.
- 338 c BURY, RICHARD A.....Asst. Gen. Tie Agent, New York Central Lines, 76 Seward Ave., Detroit, Mich.
- 83 a CABOT, SAMUEL.....Mfg. Chemist, 141 Milk St., Boston, Mass.
- c CALDER, R. J.....Secy-Treas., International Creosoting & Construction Co., Galveston, Tex.

- 190 c CAMPBELL, J. H.....Chief Chemist, R. W. Hunt & Co., 2200 Insurance Exchange, Chicago, Ill.
- 43 c CARD, J. B.....Manager, Chicago Creosoting Co., 30 N. LaSalle St., Chicago, Ill.
- 276 c CECIL, WM. A.....Wood-Preserving Engineer, Indiana Tie Co., Citizens National Bank Building, Evansville, Ind.
- 257 c CHADBOURNE, B.....Asst. Supt., Pacific Creosoting Co., Creosote, Wash.
- 302 c CHAPIN, E. T.....Pres., The E. T. Chapin Co., 2008 Railway Exchange Bldg., St. Louis, Mo.
- 69 c CHERRINGTON, F. W....Chief Engr., Jennison-Wright Co., 313 Huron St., Toledo. O.
- 19 c CHRISTIAN, EDMUND...Gen. Mgr., Norfolk Creosoting Co., Norfolk, Va.
- 57 a CHURCH, SUMNER R....Manager, Research Dept., The Barrett Co., 17 Battery Place, New York.
- 165 c CLARKE, G. S.....Vice-Prest. & Gen. Mgr., The Reeves Co., 809 Whitney-Central Bldg., New Orleans, La.
- 184 c CLARK, W. DENNISON..Vice-Prest. & Gen. Mgr., Columbia Creosoting Co., 810 Lewis Bldg., Portland, Ore.
- 318 c CLEMENTS, A. B.....Vice-Prest., United States Wood Preserving Co., 165 Broadway, New York.
- 319 p CLEMENTS, CYRIL M..Sales Engineer, The Barrett Co., Philadelphia, Pa.
- 174 c CLIFTON, W. H.....Lumber Agent, Baltimore & Ohio R. R. Co., Baltimore, Md.
- 249 c COBEAN, CHAS. E.....Supt., Pacific Creosoting Co., Creosote, Wash.
- 188 a COCKE, W. H.....Pres., Commercial Acid Co., 3943 Duncan Ave., St. Louis, Mo.
- 157 c COLLIER, H. L.....Chief of Construction, City of Atlanta, Ga.
- 218 c COLLIVER, S. R.....Treatment Inspector, A., T. & S. F. Ry., Topeka, Kan.
- 67 c COLMAN, GEO. A.....The J. M. Colman Co., Colman Bldg., Seattle, Wash.
- 221 c COOPER, S. D.....Chief Inspector, A., T. & S. F. Ry., Topeka, Kan.
- 31 c CRAWFORD, CARL G....Gen. Mgr., American Creosoting Co., 808 Columbia Bldg., Louisville, Ky.
- 80 c CURTIS, W. W.....Pres. & Treas., The Rapson Coal Mining Co., Box 485, Colorado Springs, Colo.
- 25 c DAVIDSON, G. M.....Chemist & Engineer of Tests, C. & N. W. Ry. Co., Chicago, Ill.
- 143 c DAVIES, E. T.....Inspector, City Engineer's Office, Minneapolis, Minn.
- 84 c DE CEW, J. A.....Chemical Engineer, McGill Bldg., Montreal, Canada.
- 272 c DELIUS, E. A.....Bookkeeper, Pacific Creosoting Co., Seattle, Wash.
- 204 c DEMUTH, R. E.....Testing Engineer, 22 Hayward Ave., Baltimore, Md.
- 223 c DIXON, G. C.....Tie Treating Inspector, N. Y. C. Lines, Box 763, Indianapolis, Ind.
- 64 c DIXON, J. H.....Forestry Branch, Dept. Natural Resources, Canadian Pac. Ry., Calgary, Alberta, Canada.
- 119 c DOUGHERTY, CURTIS...Chief Engineer, Queen & Crescent R. R., Cincinnati, O.
- 303 c DOVEY, J. THOMAS....Pres., The Seattle Engineering Co., 724 Central Building, Seattle, Wash.
- 290 c DOW, ALLAN W.....Consulting Engineer, Dow & Smith, 131 E. 23rd St., N. Y.
- 121 c DRAPER, E. G.....Pres., American Creosoting Co. of N. J., 17 Battery Place, New York.
- 166 a DREFAHL, LOUIS C....Chemist, Grasselli Chemical Co., 880 The Arcade, Cleveland, Ohio.
- 93 c DRINKER, W. W.....Asst. Engineer, Erie R. R. Co., 50 Church St., New York.
- 178 c DUNSTAN, J. H.....Supt., Southern Creosoting Co., Slidell, La.
- 211 c DURHAM, J. H.....Vice-Prest., American Creosoting Co., Louisville, Ky.
- 322 c DUTTON, ELLIS R.....Asst. City Engr., City Hall, Minneapolis, Minn.
- 202 a EASTWICK, CHAS. H....Pres., The Northeastern Co., 6 Beacon St., Boston, Mass.
- 297 a ELLIOTT, J. A.....Tie & Timber Contractor, 1609 Mound Ave., Jacksonville, Ill.
- 275 c EMERSON, HARRINGTONPres., The Emerson Co., 30 Church St., New York.
- 76 c EPPINGER, JESSE I....Gen. Mgr., Eppinger & Russell Co., 165 Broadway, New York.
- 163 c ERICSON, L. T.....Engineer, American Creosoting Co. of N. J., 17 Battery Place, New York.
- 158 c FANT, A. E.....Gen. Mgr., Gulfport Creosoting Co., Gulfport, Miss.

- 9 h FAULKNER, E. O.....Mgr., Tie & Timber Dept., A., T. & S. F. Ry., Kerckhoff Bldg., Los Angeles, Cal.
- 159 a FENN, FRANK D.....Mgr., Railroad Sales Dept., The Crane Co., Chicago, Ill.
- 239 c FERGUSSON, HUBERT.....Gen. Mgr., Burt, Boulton & Haywood, Ltd., Prince Regent's Wharf, Silverton, Victoria Docks, London, England.
- 237 c FINKE, W. F. H.....Tie & Timber Agent, Southern Ry. Co., Washington, D. C.
- 62 c FISHER, WM. A.....Lembeke, von Bernuth Co., 171 Madison Ave., New York.
- 308 a FOERSTERLING, DR. H.....Vice-Prest., Roessler & Hasslacher Chemical Co., 380 High St., Perth Amboy, N. J.
- 77 c FOLEY, JOHN.....Forester, P. R. R. Co., Broad St. Station, Philadelphia, Pa.
- 106 c FORD, C. F.....Supt. Tie and Timber Dept., C., R. I. & P. R. R., 325 LaSalle St. Sta., Chicago, Ill.
- 296 c FORREST, CHAS. N.....Chief Chemist, Barber Asphalt Paving Co., Maurer, N. J.
- 313 c FOWLER, J. W.....Asst. Efficiency Engineer, Baltimore & Ohio R. R. Co., Baltimore, Md.
- 117 c FREY, GEO. W.....Secy.-Treas. & Mgr., Compressed Wood Preserving Co., 4600 Spring Grove Ave., Cincinnati, O.
- 333 c FRISTOE, J. W.....Prest., T. J. Moss Tie Co., Security Bldg., St. Louis, Mo.
- 38 c FULKS, E. B.....Vice-Prest., American Tar Products Co., 208 S. LaSalle St., Chicago, Ill.
- 160 a FULWEILER, W. H.....Chemist, United Gas Improvement Co., 1706 N. Broad St., Philadelphia, Pa.
- 306 a FURLONG, L. A.....Vice-Prest., The Valentine-Clark Co., Security Bldg., Minneapolis, Minn.
- 44 a GERHARD, H. H.....Prest., C-A Wood-Preserver Co., 807 Wright Bldg., St. Louis, Mo.
- 39 c GIBSON, ANDREW.....Engineer Maintenance of Way, No. Pac. Ry., St. Paul, Minn.
- 161 a GIBSON, LOUIS S.....Secy., Sandoval Zinc Co., 410 N. Peoria St., Chicago, Ill.
- 180 a GIBSON, W. C.....Sales Engineer, Allis-Chalmers Mfg. Co., Milwaukee, Wis.
- 316 p GOLDSTEIN, H. I.....Highway Inspector, Bureau of Highways, Dept. of Public Works, 4200 Woodland Ave., Philadelphia, Pa.
- 56 c GOLTRA, W. F.....Prest., W. F. Goltra Tie Co., Rockefeller Bldg., Cleveland, O.
- 288 c GOSLINE, C. E.....Treating Inspector, D., L. & W. R. R. Co., Paterson, N. J.
- 277 c GOSS, O. P. M.....Consulting Timber Engineer, Seattle, Wash.
- 243 c GRADY, W. H.....Asst. Gen. Supt., American Creosoting Co., Louisville, Ky.
- 100 c GRAHAM, FLOYD N.....Timber Inspector, C. G. W. R. R. Chicago, Ill.
- 170 c GREEN, DONALD W.....Secy., Columbia Creosoting Co., 809 Lewis Bldg., Portland, Ore.
- 232 c GRIFFIN, RUSSELL A.....Mgr. Pole Dept., Western Electric Co., 463 West St., New York.
- 334 c GRIGGS, E. G.....Prest., St. Paul & Tacoma Lumber Co., Tacoma, Wash.
- 321 c GRIMES, I. B.....Plant Supt., National Lumber & Creosoting Co., Houston, Tex.
- 72 a GROW, J. H.....Sales Engineer, Allis-Chalmers Mfg. Co., Milwaukee, Wis.
- 231 c HAGGANDER, G. A.....Asst. Bridge Engineer, C., B. & Q. R. R. Co., 547 W. Jackson Blvd., Chicago, Ill.

- 12 c LOGAN, JOHN T.....Prest., National Lumber & Creosoting Co., Texarkana, Ark.
 242 c LOOK, RICHARD V.....Prest., Canada Creosoting Co., Ltd., 1 King St. E., Toronto, Canada.
 112 c LORD, RUSSELL.....Ayer & Lord Tie Co., Railway Exchange, Chicago, Ill.
 61 c LOUD, H. S.....Vice-President, Railway Tie Treating Co., 165 Broadway, N. Y.
 73 a LOUNSBURY, JAS. A.....Vice-Prest., Greenlee Bros. & Co., Rockford, Ill.
 151 a LUND, C. A.....Mgr., C. A. Lund Co., Merriam Park P. O., St. Paul, Minn.
 196 c MAITLAND, G. F.....Division Engineer, Union Pacific R. R. Co., Kansas City, Mo.
 41 c MANLEY, R. S.....Prest., Creosoted Wood Block Paving Co., Queen & Crescent Bldg., New Orleans, La.
 p MANION, KERON.....Asst. Supt., American Creosoting Co., Newark, N. J.
 263 c MARRIOTT, F. G.....Engineer of Tests, Department of Works, Foot of Princess St., Toronto, Can.
 336 a MARTIN, JAS. R.....Vice-Prest., Western Silo Co., Des Moines, Iowa.
 329 p MARTIN, LYMAN C.....Clerk, American Creosoting Co., Indianapolis, Ind.
 250 c MARTIN, F. R.....Treating Inspector, C. & E. I. R. R. Co., Box 856, Marion, Ill.
 137 c MATTOS, F. D.....Supt., Creosoting Works, Southern Pacific Co., West Oakland, Cal.
 52 c McARDLE, FRANK.....Supt. Tie Plant, Indiana Zinc Creosoting Co., Terre Haute, Ind.
 279 c McCANDLESS, S. F.....Mgr. Tie Dept., Canada Creosoting Co., 1 King St. E., Toronto, Can.
 113 c MEREDITH, W. C.....Supt., Southern Wood-Preserving Co., Atlanta, Ga.
 71 c MEYER, AUGUST.....Supervisor Tie Plant, C. B. & Q. R. R. Co., Galesburg, Ill.
 70 a MILLS, W. C.....Salesman, Grasselli Chemical Co., The Arcade, Cleveland, O.
 185 c MIMS, L.....Fuel & Timber Agent, Southern Pacific Co., Houston, Tex.
 32 a MITCHELL, L. E.....Prest., Dallas, Corsicana & Palestine Ry., Palestine, Tex.
 164 c MOLL, DR. FRIEDRICH..4 Brändenburgische St., Sudende, Berlin, Germany.
 254 c MOORE, ROBERT H.....Chief Engineer, American Creosoting Co., Louisville, Ky.
 114 c MOSES, L. B.....Sales Manager, The Kettle River Co., Plymouth Bldg., Minneapolis, Minn.
 309 c MURCHIE, WILFRED E.....Consulting Inspector, Shillito & Murchie, Maritime Exchange Bldg., New York.
 240 c MURRAY, D. L.....Gen. Foreman, Tie Plant, Santa Fe Tie & Lbr. Pres. Co., Somerville, Tex.
 307 p MYERLY, J. R.....Treating Engr. Timber Preserving Plant, Baltimore & Ohio R. R. Co., Green Spring, W. Va.
 50 c NEWTON, H. M.....Manager of Plants, The Kettle River Co., Plymouth Bldg., Minneapolis, Minn.
 283 a NIXON, E. A.....Vice-Prest., Western Tie & Timber Co., 905 Syndicate Trust Bldg., St. Louis, Mo.
 314 a NIXON, WARREN C.....Secy., Western Tie & Timber Co., 905 Syndicate Trust Bldg., St. Louis, Mo.
 186 c NOYES, A. H.....Secy.-Treas., Ayer & Lord Tie Co., 1515 Railway Exchange, Chicago, Ill.
 146 c NOYES, GEO. W.....Supt., Timber Treating Plant, M., K. & T. Lines, Denison, Tex.
 33 a OKES, DAY.....Contractor & Engineer, Hanlon & Okes, 319 Lumber Exchange, Minneapolis, Minn.
 337 c ORUMM, EDMUND O....Chief Inspector, Seattle Port Commission, Avalon Apartments, Seattle, Wash.
 273 c PADDOCK, EDW. F.....Chem. Engr., Carbolineum Wood Pres. Co., 182 Franklin St., New York.
 253 c PARK, ERNEST S.....Sales Engineer, The Rodd Co., 1402 Commonwealth Bldg., Pittsburgh, Pa.
 26 c PARMINTER, L. I.....Sales Agent, Long Bell Lumber Co., Long Bldg., Kansas City, Mo.
 268 c PARROTT, R. D.....Prest. & Gen. Mgr., Atlantic Creosoting & Wood Preserving Works, Norfolk, Va.
 271 c PAUL, H. A.....Treating Inspr., C., R. I. & P. and M. P. Ry., Tie Plant, Ark.
 343 c PEARSON, R. S.....Forest Economist, Forest Research Institute, Dehra Dun, U. P. India.

- 227 c PERRY, ARTHUR W....Night Gen. Foreman, Santa Fe Tie & Lbr. Pres. Co.,
Somerville, Tex.
- 191 c PESTEL, A. C.....Supt. Tie Treating Plant, O., W. R. R. & N. Co., Wyeth, Ore.
- 217 c PINSON, J. F.....Asst. Engineer Bridge & Buildings, C. M. & St. P. Ry.,
Seattle, Wash.
- 142 c POLLOCK, SAMUEL, T....Asst. Supt. Tie Plant, Atlantic Coast Line, Gainesville, Fla.
- 115 c POOLER, F. S.....Tie Agent, C. M. & St. P. Ry., 1352 Railway Exchange,
Chicago, Ill.
- 182 c POWELL, A. O., Jr.....Chemical Engineer, 404 Central Bldg., Seattle, Wash.
- 91 c POWELL, E. L.....Pres., New Orleans-Cuban Steamship Co., 802 Canal Bank
Bldg., New Orleans, La.
- 284 c QUINCY, R. B.....Representing R. W. Hunt & Co., 1022 Hibernian Bldg.,
New Orleans, La.
- 261 c RAWSON, R. H.....Supt. of Plant, St. Helens Creosoting Co., St. Helens, Ore.
- 331 c RAY, JOHN R.....Inspector in Charge Gulf States Lumber Inspection, Public
Service Commission of N. Y., New Orleans, La.
- 155 c RECORD, S. J.....Asst. Prof., Forest School, Yale University, New Haven,
Conn.
- 226 c REDMAN, KENNETH.....Chemist, Pacific Creosoting Co., Creosote, Wash.
- 325 a REID, JOS. S.....Secy. & Treas., Clark Bros. Co., Olean, N. Y.
- 54 c REX, GEORGE E.....Manager Treating Plants, A., T. & S. F. Ry., Topeka, Kan.
- 228 a RIDSDALE, P. S.....Secy., American Forestry Ass'n, 1410 H St., N. W.,
Washington, D. C.
- 131 c ROBERTS, G. G.....1 Clarges St., Piccadilly W., London, England.
- 278 p ROBINSON, DONALD....Student in Chemistry, 6538 Norman Blvd., Chicago, Ill.
- 133 c RODD, THOS., Jr.....1402 Commonwealth Bldg., Pittsburgh, Pa.
- 264 c ROE, GEORGE J.....Asst. Treating Engineer, Pacific Creosoting Co., Creosote,
Wash.
- 14 c ROLLINS, H. M.....Supt., Gulfport Creosoting Co., Gulfport, Miss.
- 311 c ROTH, E. J.....Purchasing Agent, C. I. & L. Ry., 608 S. Dearborn St.,
Chicago, Ill.
- 310 c ROWLAND, J. W.....General Tie Inspector, Baltimore & Ohio R. R. Co.,
Baltimore, Md.
- 241 a RUEPING, MAX.....Owner, Hulsberg & Co., Lessingstra, Berlin, Germany.
- 90 c RUFLI, H. M.....Supt., Republic Creosoting Co., Indianapolis, Ind.
- 78 c RYAN, W. J.....Supt., National Lumber & Creosoting Co., Texarkana, Ark.
- 286 c SACKETT, H. S.....Nat'l Lbr. Mfr's Assoc., 925 Lumber Exchange, Chicago, Ill.
- 330 c SAPOJNIOFF, SERGE...Engineer-Chemist, Principal Asst. to Chief of Wood-Preserv-
ing Laboratory of Russian Ministry of Railways, Petro-
grad, Russia.
- 63 c SCHILLING, FRANK....Supt., Eppinger & Russell Co., Long Island City, N. Y.
- 126 a SCHMOOK, KARL.....Representing Guido Rutgers Kammandit Co., 20 Liechten-
steinstrasse, Vienna, Austria.
- 206 c SCHNATTERBECK, C. C. Editor, "Wood-Preserving," Mt. Royal Station, Baltimore, Md.
- 101 c SCHOLTZ, A. C.....Supt., T. J. Moss Tie Co., Mt. Vernon, Ill.

- 134 c WEBER, J. M.....Supt., Ohio Wood Preserving Co., Orrville, O.
- 173 c WEGENER, RALPH H....Inspector, St. Paul & Tacoma Lumber Co., 902 North M. St., Tacoma, Wash.

- 305 a WEGENER, RICHARD....Preservatives Salesman, 627 27th St., Milwaukee, Wis.
 79 h WEISS, HOWARD F....Director, Forest Products Laboratory, Madison, Wis.
 171 c WELSH, C. T.....Asst. Plant Operator, Republic Creosoting Co., Plymouth Bldg., Minneapolis, Minn.
 177 c WHITE, THOS.....Asst. Mgr., American Creosote Works, Station B, New Orleans, La.
 149 c WIGGETT, C. H.....Supt. Tie Plant, El Paso & Southwestern System, Alamogordo, N. M.
 47 c WILLIAMS, J. C.....Supt. Wood-Preserving Works, Barber Asphalt Paving Co., Maurer, N. J.
 138 c WILLIAMS, R. R.....Vice-Prest. & Treas., Indiana Tie Co., Citizens National Bank Bldg., Evansville, Ind.
 245 c WILLIAMSON, H. E.....Gen. Foreman Timber Preserving Plant, C., B. & Q. R. R., 307 E. First St., Sheridan, Wyo.
 102 c WINSLOW, CARLILE P..Engineer in Forest Products, Forest Products Laboratory, Madison, Wis.
 125 c WINSLOW, GEOFFREY..Mgr., Creosoting Dept., St. Paul & Tacoma Lumber Co., Tacoma, Wash.
 235 c WIRTH, PHILIPP.....Prest., Anthrol Wood Preserving Co., 332 Spring St., New York.
 259 c WOODWARD, G. W.....Asst. Supt. Timber Preserving Plant, B., R. & P. Ry. Co., Bradford, Pa.
 298 c WRIGHT, W. E.....Manager Sales, Jennison-Wright Co., 313 Huron St., Toledo, O.
 c ZELLER, W. C.....Supt., American Creosoting Co., Newark, N. J.
 234 c ZWINGAUER, N.....Director, Rutger Works, Lutzowstrasse, Berlin, Germany.

Corrected to December 1, 1916.

BIBLIOGRAPHY OF WOOD PRESERVATION.

PUBLICATIONS:

- Associated Factory Mutual Fire Insurance Companies, Inspection Dept., Boston, 1915.
Dry Rot: F. J. Hoxie.
- McGraw-Hill Book Co., New York, 1915-1916.
Preservation of Structural Timber: H. F. Weiss.
- Pettibone, Sawtell & Co., Chicago, 1904.
Preservation of Timber: Samuel M. Rowe.
- Southern Pine Association, New Orleans, La., 1916.
Floors of Service.
- D. Van Nostrand Publishing Co., New York, 1885.
The Preservation of Timber by the Use of Antiseptics: Samuel B. Boulton.
- West Coast Lumber Manufacturers' Association and Association of Creosoting Companies of Pacific Coast, Seattle, Wash., 1916.
Creosoted Douglas Fir Paving Blocks.
Structural Timber Handbook on Pacific Coast Woods: O. P. M. Goss and Carl Heinmiller.
- U. S. Dept. of Agriculture, Forest Service, Washington, D. C.

Wood=Preserving

C. C. SCHNATTERBECK, Editor.

PUBLISHED QUARTERLY

UNDER THE DIRECTION OF THE EXECUTIVE COMMITTEE

American Wood-Preservers' Association

YOU MUST READ

Wood=Preserving

SHOULD YOU WISH

- To **Promote** the **use of wood** for all purposes to which it is adapted.
 - To **Encourage** the **preservative treatment** of wood wherever decay is a factor in its service.
 - To **Keep posted** on the development of **materials** and **processes** for effectively treating wood.
 - To **Learn** more about the **economical operation** of **wood-preserving plants**.
 - To **Assist** in the **propaganda** for the **general conservation** of our **forest resources**.
-
